Presenter: Krishna Jagannathan

Load Balancing for Distributed Networks

Motivations

Cabel Supply Market
Balance

Network Load Balance

Cloud Computing

Goal: Load Balancing

- **A Nash-equilibrium**: A state that no user has the incentive to change her current decision.

Convergence in the Networking System ASAP

Outline

- 1 Introduction
- 2 **FCD Load Balancing Algorithm**
 - Problem Formulation
 - Exploration and Backtracking Probability
- 3 Performance Analysis and Guarantees
 - Convergence Time Guarantee
- 4 Open Systems
 - System Model
 - Guarantees
- 5 Numerical Results
- 6 Conclusion

- 5 Numerical Results
- 6 Conclusion

System Model

Notation

- Server load $X_i(t)$:= # of users in server i at time slot t
- Load experience $Y_a(t)$ by user a at t
- ϵ -nash equilibrium:

$$\max_{ij} |X_i(t) - X_j(t)| \leq \epsilon \frac{m}{n}$$

m users(unit bandwidth requirement), n servers,

$$m \gg n$$

System Model

Notation

- Server load $X_i(t)$:= # of users in server i at time slot t
- Load experience $Y_a(t)$ by user a at t
- ϵ -nash equilibrium:

$$\max_{ij} |X_i(t) - X_j(t)| \leq \epsilon \frac{m}{n}$$

m users(unit bandwidth requirement), n servers,

$$m \gg n$$

What's different from traditional load balancing?

- **No Dispatcher**: Random local search in Distributed System
- **Concurrently Implemented**: Entails the design of load estimation mechanisms due to indirect observations
 - * "Elementary Step System" vs Concurrent Process
- **Switching Penalty**: Entails a careful design of exploration probabilities, "trade-off"
- **Extension to open systems**: User dynamics, a wide class of arrival and departure processes

Outline

A Toy Case with 2 Servers

- Explore with $\gamma_{t_0} = \frac{2}{3}$

Initial State

A Toy Case with 2 Servers

- Explore with $\gamma_{t_0} = \frac{2}{3}$
- **Red** users observe

$$Y_r(t_0) = X_1(t_0) = 9$$

$$Y_r(t_1) = X_2(t_1) = 7$$

Blue users observe

$$Y_b(t_0) = X_2(t_0) = 3$$

$$Y_b(t_1) = X_1(t_1) = 5$$

Exploration

A Toy Case with 2 Servers

- Explore with $\gamma_{t_0} = \frac{2}{3}$
- **Red** users observe

$$Y_R(t_0) = X_1(t_0) = 9$$

$$Y_R(t_1) = X_2(t_1) = 7$$

Blue users observe

$$Y_b(t_0) = X_2(t_0) = 3$$

$$Y_b(t_1) = X_1(t_1) = 5$$

- **Red** users backtrack with prob.= $\frac{1}{2}$
- **Blue** users backtrack with prob.= 1

Backtracking

Exploration and Backtracking Probability

Exploration Probability γ_t

Initial State

Exploration and Backtracking Probability

Exploration Probability γ_t

- Why need a decaying exploration rate? **Stable**
- Binary search

Exploration

Exploration and Backtracking Probability

Exploration Probability γ_t

- Why need a decaying exploration rate? **Stable**
- Binary search

Backtracking Probability

$$f_{ji} := \{x_i(t-1), x_j(t), \gamma_t\}$$

- Decision made based on observed server loads at $t-1$ and t for each user.

Backtracking

Parameter Estimation-backtracking prob.

Initial

Exploration

Backtracking

The Design of Backtracking Probability

- Case 1: Blue User Switches from Lighter Load to Heavier Load

$$f_b(1) := f(Y_b(1), Y_b(0), \gamma_1) = 1$$

Parameter Estimation-backtracking prob.

Initial

Exploration

Backtracking

The Design of Backtracking Probability

- Case 1: Blue User Switches from Lighter Load to Heavier Load

$$f_b(1) := f(Y_b(1), Y_b(0), \gamma_1) = 1$$

- Case 2: Red User Switches from Heavier Load to Lighter Load

$$f_r(1) := f(Y_r(1), Y_r(0), \gamma_1)$$

Criterion: Single Step Convergence Enforcement Strategy

$$\mathbb{E}[X_1(2)] = \mathbb{E}[X_2(2)]$$

Parameter Estimation-backtracking prob.

Initial

Exploration

Backtracking

The Design of Backtracking Probability

- Case 1: **Blue** User Switches from Lighter Load to Heavier Load

$$f_b(1) := f(Y_b(1), Y_b(0), \gamma_1) = 1$$

- Case 2: **Red** User Switches from Heavier Load to Lighter Load

$$f_r(1) := f(Y_r(1), Y_r(0), \gamma_1)$$

Criterion: Single Step Convergence Enforcement Strategy

$$\mathbb{E}[X_1(2)] = \mathbb{E}[X_2(2)]$$

Extension to n server case

Backtracking Probability be affected by other servers as well: partial information Idea: **Mathematical induction** + **Information estimation**

Closed system convergence time Guarantee

- Convergence time guarantee

$$\mathbb{E}[T] \leq \max \left\{ n \log n + n^{\frac{1}{\beta}}, \left[\left(\frac{n}{m} \right)^3 \log n \right]^{\frac{1}{\beta}} \right\}$$

where exploration probability $\gamma_t = t^{-\beta}$,
 $\beta \in [0.5, 1]$ and $m \gg n$.

Closed system convergence time Guarantee

- Convergence time guarantee

$$\mathbb{E}[T] \leq \max \left\{ n \log n + n^{\frac{1}{\beta}}, \left[\left(\frac{n}{m} \right)^3 \log n \right]^{\frac{1}{\beta}} \right\}$$

where exploration probability $\gamma_t = t^{-\beta}$,
 $\beta \in [0.5, 1]$ and $m \gg n$.

Closed system convergence time Guarantee

- Convergence time guarantee

$$\mathbb{E}[T] \leq \max \left\{ n \log n + n^{\frac{1}{\beta}}, \left[\left(\frac{n}{m} \right)^3 \log n \right]^{\frac{1}{\beta}} \right\}$$

where exploration probability $\gamma_t = t^{-\beta}$,
 $\beta \in [0.5, 1]$ and $m \gg n$.

What if new users arrive or current users depart after the closed system starts?

Arrival and Departure Processes

$A(t)$ # of arrival users

$$E[B_i(t)] = A(t) / n$$

$$X_i^+(t) = X_i(t) + B_i(t)$$

Notation

- Users depart **rate** : $\nu_i(t) \propto X_i^+(t)$
- Users depart **number** : $\nu_i(t) X_i^+(t)$
- Real time load : $X_i^F(t) := X_i^+(t) - \nu_i(t) X_i^+(t)$

Convergence Time Guarantees

Open System

- Real time system load constraints

$$\Pr \left\{ \left| M(t) - \left(1 - \frac{\gamma_t}{n-1} \right) m \right| > n^{-\frac{1}{2}} m^2 \sqrt{\gamma_t} \right\} \leq \frac{\epsilon^2}{4n^2}$$

where $M(t)$ is the real time system load.

Convergence Time Guarantees

Open System

- Real time system load constraints

$$\Pr \left\{ \left| M(t) - \left(1 - \frac{\gamma_t}{n-1} \right) m \right| > n^{-\frac{1}{2}} m^2 \sqrt{\gamma_t} \right\} \leq \frac{\epsilon^2}{4n^2}$$

where $M(t)$ is the real time system load.

- Convergence time guarantee

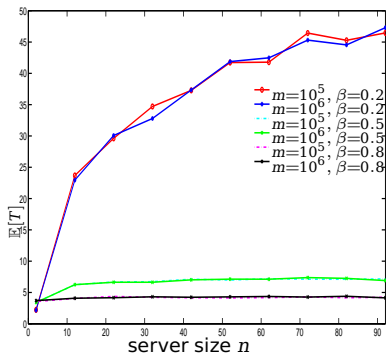

$$\mathbb{E}[T] \leq \max \left\{ n \log n + n^{\frac{1}{\beta}}, \left[\left(\frac{n}{m} \right)^3 \log n \right]^{\frac{1}{\beta}}, \left(\frac{n^4}{\epsilon m^3} \log n \right)^{\frac{1}{\beta}} \right\}$$

where $\beta \in [0.5, 1]$.

- 3 Performance Analysis and Guarantees
 - Convergence Time Guarantee
- 4 Open Systems
 - System Model
 - Guarantees
- 5 Numerical Results**
- 6 Conclusion

$\mathbb{E}[T]$ under different configurations

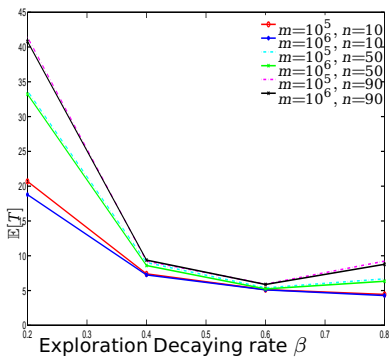

Converge linearly with n

Convergence time is robust with m

$\mathbb{E}[T]$ under different configurations

Converge slower with smaller β

Conclusion

Summary

- Proposed **fast** and **concurrent** randomized local search algorithm for **distributed** system
- Convergence time guarantees are analyzed in **closed/open** systems
- **Robustness** of the algorithm with dynamic users in **open** system
